# Collaborating with Academia

#### Scott V. Dindot, Ph.D.

Associate Professor | Texas A&M University Executive Director Molecular Genetics | Ultragenyx Pharmaceutical November 7, 2023

> Ultragenyx Pharmaceutical RARE Entrepreneurship Bootcamp

Opinions based on my experiences and perspective

A cynical tactic to illustrate the nuances albeit factual — of collaborating with academic researchers

### My Background

- Faculty Member, Texas A&M University (2008-present)
- Chief Scientific Officer, GeneTx Biotherapeutics (2017-2020)
- Executive Director Molecular Genetics, Ultragenyx Pharmaceutical (2020-present)

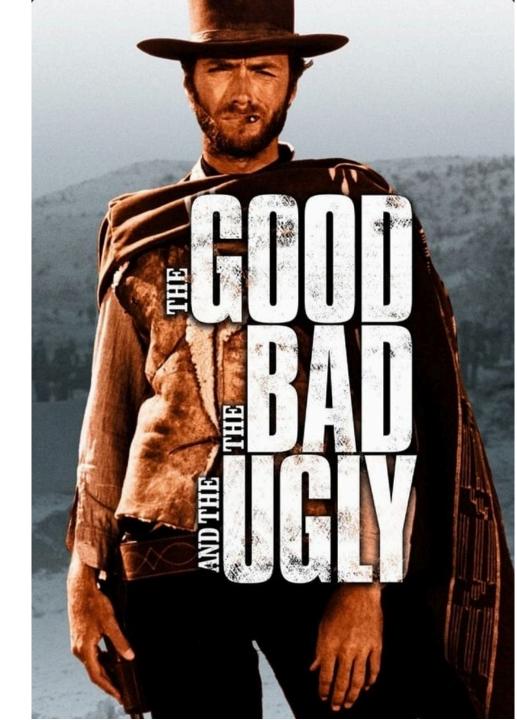

### My Background

- Continuous funding from federal agencies, foundations, companies, and licensing agreements.
- 15 years collaborating with rare disease foundations.
- Lab invented the first investigational molecular therapy for Angelman syndrome to advance into clinical development.

The Angelman syndrome ubiquitin ligase localizes to the synapse and nucleus, and maternal deficiency results in abnormal dendritic spine morphology

Received August 24, 2007; Revised and Accepted September 27, 2007

Loss of function of the maternally inherited allele for the UBE34 ubiquitin ligase gene causes Angelman syndrome (AS), which is characterized by severe neurological impairment and motor dysfunction. In addition, UBE34 lies within chromosome 15q11-q13 region, where maternal, but not paternal, duplications cause autism. The UBE34 gene product, E6-AP, has been shown to function both as an E3 ligase in the ubiquitin proteasome pathway and as a transcriptional coactivator. However, the specific role of E6-AP in the brain, or how loss of function of E6-AP results in AS, is unclear. Herein, we show, using a recombinant transgenic mouse expressing a Ube3a<sup>VPP</sup> losion gene, that the maternal Ube3a<sup>VPP</sup> allele is upregulated and preferentially expressed in neurons, and that the fusion protein, E6-AP:YFP, is enriched in the nucleus and dendritics *in vivo*. We also show that E6-AP:YFP localizes to the nucleus and to presynaptic and postsynaptic compartments in cultured hippocampal neurons. Furthermore, we show that creebellar Purkinje cell number and dendritic branching are not affected in *Ube3a* maternal-deficient mice, but that dendritic spine development, including spine morphology, number and length, is affected on cerebellar Purkinje cells and on pyramidal neurons in the hippocampus and cortex. Collectively, these data suggest that the neurological deficits observed in AS patients and in AS mice may result from specific abnormalities in synaptic development and/ or plasticity.

#### INTRODUCTION

Mice with a maternal null mutation in Ube3a (AS mice) Angelman syndrome (AS) is characterized by severe mental have defects in long-term potentiation (LTP) and manifest retardation, absence of speech, ataxia and a happy disposition motor and behavioral abnormalities that parallel findings in (1,2). The AS gene, UBE3A, encodes the E6-AP ubiquitin AS in spite of normal cellular architecture in the brain (9). ligase and is subject to genomic imprinting, with preferential The neurological deficits in AS mice have been directly maternal-specific expression in brain and, more specifically, in linked to the postsynaptic calcium/calmodulin kinase type 2 neurons but not in glia (3,4). Maternal but not paternal inters- (CaMKII) signaling pathway, as AS mice have increased titial duplications of chromosome 15q11-q13 cause autism inhibitory phosphorylation of  $\alpha$ CaMKII in the brain (10) (5). These duplications encompass multiple genes, but Moreover, the learning and behavioral deficits present in AS UBE3A is a strong candidate to contribute to the autism mice can be rescued through a mutation in CaMKII that pre phenotype in 15q11-q13 duplication cases based on its vents its inhibitory phosphorylation (11). Other reports have imprinted status and known causative role in AS (6). Autism linked E6-AP to various neurologically relevant proteins spectrum disorders are seen with Prader-Willi syndrome including epithelial cell-transforming sequence 2 oncogene and AS, the two phenotypes associated with paternal and (Ect2) (12), neuronal protein interacting specifically with maternal deletions of 15q11-q13, respectively (7,8). TC10 (nPIST) (13) and myc-binding protein-2 (MYCBP2)

### Academic Research

An unusual business model involving the most unusual people

### Academic Collaborators

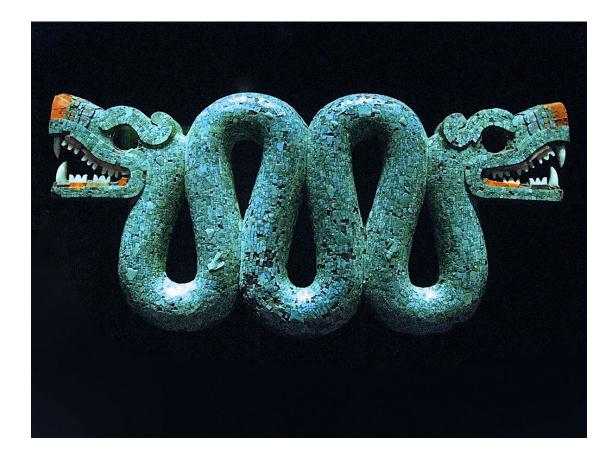

One collaborator is many partners with different priorities

#### **Principal Investigator Priorities**

- Tenure and Promotion
- Solvency
- Trainees

#### **Other priorities**

- Teaching
- Lab/personnel situation
- Risk
- Competition

#### **Institutional Priorities**

- Academic freedom
- Protecting faculty and trainees
- Intellectual property

#### **Other priorities**

- Business model
- National status
- Politics
- Internal initiatives

### Academic Science There is too much of it, and most of it is wrong

# Your Journey with an Academic Collaborator *Expectation*

### Your Journey with an Academic Collaborator Reality

### Conclusions

- Academic research is the engine that drives innovation, but it is a unique and often misunderstood ecosystem - try to understand it.
- Find a collaborator who understands your objectives and timelines, and try to understand their objectives and timelines every person and situation is different.
- Trust your academic collaborator, but do not make assumptions about their situation, environment, institution, etc. – find out as much as you can as early as possible.
- Be dubious about scientific publications, scientific claims, timelines, etc. it is the nature of research to embellish and overpromise.
- Be focused but expect twists and turns and failures and frustrations they are inevitable.

## Thank you!
